specialist in milk & fat

High risk of infection
by diarrhoea pathogens

Calf diarrhoea continues to cause major problems on many farms. Studies have shown that cryptosporidia form the largest part of diarrhoea pathogens. Once a farm is infected the best colostrums management and hygiene methods will not help.

Besides the well known diarrhoea pathogens like e.coli, rota- and corona viruses infections caused by cryptosporidia increasingly lead to problems in calf rearing. During this time the active immunity of the calf is not fully developed. In order to secure rearing at high risk of infections a support of the calf is useful.

- Cryptosporidia have become to the most frequent diarrhea causing pathogens.
- Cryptosporidia are very resistant and very difficult to control.

BEWITAL agri
specialist in milk & fat

Our solution:

BEWI-SAN Prevent C

"Safe rearing also at high risk of infection."

- NEW: Now additionally with carob pods meal, has a supportive effect on unspecific digestive problems due to the high proportion of swellable fiber
- Special formulation with organic acids supports digestion and stabilises the colostrum for at least 12 hours
- Lactic acid bacteria protect the intestinal mucosa and promote the natural intestinal flora
- Essential vitamins and trace elements prevents signs and symptoms of deficiency
- With appetising fenugreek

Uses:

In the case of a high likelihood of infection due to diarrhoea pathogens such as cryptosporidia, E. coli or rotaviruses/coronaviruses. Stir into the milk at 10 g/litre of drink starting at the second meal in the calf's first 8-14 days of life (at least 60 g per calf daily).

- **BEWI-SAN Prevent C** supports the immunity of the calf during the first two weeks of life.

Now with additional **carob pods meal** for even more stable digestion.
